

Ex.No:4 Perform IT Project Audit and generate a report using open-source tools.

AIM:

To perform an IT project audit using open-source tools by examining project activities, identifying risks and issues, evaluating compliance and performance, and generating a comprehensive audit report.

ALGORITHM:

- Start the open-source IT project auditing tool.
- Create or import the IT project to be audited.
- Collect project information such as scope, schedule, resources, cost, and deliverables.
- Define the audit criteria and objectives.
- Examine project documentation, processes, and activities.
- Identify risks, issues, deviations, and compliance gaps.
- Evaluate project performance against the defined criteria.
- Record audit findings with their severity and recommendations.
- Generate the IT project audit report containing findings, risks, and corrective actions.
- Review and save the final audit report, then stop.

PROCEDURE:

- Open the selected **open-source** IT project auditing tool and create a new audit project.
- Enter the project details such as **project name, objectives, team, timeline, and deliverables**.
- Define the **audit scope, objectives, and evaluation criteria**.
- Import or enter relevant project documents, task details, schedules, and resource information.
- Review the project activities and compare the actual progress with the planned progress.
- Check the project for **risks, security issues, quality problems, cost deviations, and schedule delays**.
- Record each identified finding and assign an appropriate **severity level** such as Low, Medium, or High.
- Provide suitable recommendations and corrective actions for the identified issues.

- Generate the IT Project Audit Report containing project details, audit findings, risk levels, recommendations, and overall assessment.
- Review the generated report, save/export it, and verify that the audit results are complete and accurate.

OUTPUT:

The image displays two screenshots of the Mendix application interface, showing the initial setup and data entry phases.

Top Screenshot: Welcome to your homepage

The interface shows a navigation bar with 'Home', 'risk', 'project', and 'audit' tabs. The main content area is titled 'Welcome to your homepage' and contains two steps:

- 1 Define and organize your data**: This step involves setting up the Domain Model. A diagram shows two entities: 'YourEntity' (with attributes 'Endpoint (String)' and 'authKey (String)') and 'YourEntity2' (with attributes 'UUID (String)' and 'Status (enumeration)'). They are connected by a relationship 'YourEntity2>YourEntity'. A text box explains: 'A well-structured Domain Model forms the foundation for the components and pages you'll build next.' A 'Learn more' link is provided.
- 2 Add and connect widgets to your page**: This step involves building the page by dragging widgets from the toolbox onto the canvas.

Bottom Screenshot: Add and connect widgets to your page

This screenshot shows a form for adding and connecting widgets to a page. The form has a sidebar with a list of widgets: 'riskname', 'description', 'probability', 'impact', 'riskscore', 'mitigationplan', and 'riskstatus'. The main area contains input fields for each widget, with some fields having dropdown menus. The 'probability' field has a value of '0'. The 'riskscore' field has a value of '0'. The 'mitigationplan' field has a value of '0'. The 'riskstatus' field has a value of '0'. The 'Save' and 'Cancel' buttons are at the bottom.

RESULT:

The IT project is successfully audited using an open-source tool, and a comprehensive audit report containing the project findings, risks, issues, and recommendations is generated.
